

Integrated Emergency Lighting Power Supply

AI Overview

An Integrated Emergency Lighting Power Supply System ensures reliable illumination during power outages by centrally managing emergency lighting fixtures, batteries, and control systems in compliance with safety standards.

Overview

An Integrated Emergency Lighting Power Supply System is designed to provide continuous illumination in buildings during power failures, supporting safe egress and operational safety. These systems are commonly used in large commercial buildings, transportation hubs, and public facilities, where multiple emergency luminaires need coordinated power and monitoring .

System Components

- **Centralized Power Supply Unit (CPSU):** Acts as the core of the system, supplying AC or DC power to multiple emergency luminaires. It can include AC/AC static inverter systems or AC/DC power supply systems, maintaining nominal voltage during normal operation and switching to battery power during outages .
- **Batteries:** Centralized storage batteries, often VRLA (Valve Regulated Lead Acid) or lithium-based, provide backup power for a minimum of 90 minutes, as required by NFPA and local building codes . Battery management ensures longevity and reliability.
