

Is the cable tray galvanized or not

Overview

Common cable trays are made of galvanized steel, stainless steel, aluminum, or glass-fiber reinforced plastic. The material for a given application is chosen based on where it will be used. Dry indoor rooms should use pre-galvanized (PG) steel. The wrong one is the most common error. Two common types— Hot Dip Galvanized (HDG) and GI (Galvanized Iron) cable trays—offer corrosion protection but differ significantly in performance, durability, and application. Zinc provides sacrificial protection, which means that it corrodes while. Both pre-galvanized cable tray and hot-dip galvanized (HDG) cable tray are the two common types of cable trays, and they are essential components in electrical wiring systems, designed to support and route cables in industrial and commercial buildings.

Cable tray

Common cable trays are made of galvanized steel, stainless steel, aluminum, or glass-fiber reinforced plastic. The material for a given application is chosen based on where it will be used. Galvanized tray may be made of pre-galvanized steel sheet fabricated into tray, or may be hot-dip galvanized after fabrication. When galvanized tray is cut to length in the field, usually the cut surface will be painted with a zinc-rich compound to protect the metal from corrosion.
