

Lighting distribution box with socket

AI Overview

Socket distribution boxes provide multiple power outlets for general electrical devices, while lighting distribution boxes manage and control multiple lighting circuits, often with modular and dimming capabilities.

Socket Distribution Box

A socket distribution box is designed to distribute electrical power to multiple devices through built-in outlets. These boxes can be empty, pre-wired, or ready for connection, and often include protective features such as FI (residual current) and LS (circuit breakers) switches for safety. They may come with CEE or Schuko® sockets and are suitable for both indoor and outdoor installations, including specialized applications like bicycle charging stations. Socket boxes are modular, allowing easy expansion or adaptation to different electrical standards and international variants. They are commonly used in industrial, commercial, and temporary setups to provide multiple points of power from a single source.

Lighting Distribution Box

A lighting distribution box is specifically designed to manage lighting circuits. It allows multiple luminaires to be connected and controlled from a single point. These boxes often feature modular 7-pole connections, enabling on/off or dimming control for individual groups of lights. They are highly flexible, allowing quick installation, reconfiguration, and expansion by plugging in additional luminaire leads or expansion boxes. Lighting distribution boxes are ideal for applications where independent control of multiple lighting groups is required, such as essential and non-essential circuits in commercial or industrial buildings.
