

# Should fiber optic cables be spliced by fusion or cold splicing

## Overview

Typically terminated onto splice-on pigtails with factory-installed connectors, fusion splicing has quickly grown to be the most popular and preferred choice for fibre termination. There are two main methods of splicing: mechanical splicing and fusion splicing. It requires specific connectors to facilitate the curing process, ensuring a secure and durable bond between the fibre optic cables without the need for heat sources or specialised. Fiber optic connector termination and/or the joining of two separate fiber optic cables is known as “splicing,” and splicing can be accomplished with two common methods: Fusion splicing, as implied by the name, actually fuses the two cables together, whereas mechanical splicing simply holds the two. This is where fiber optic cable splicing—the process of creating a permanent, high-performance join between two fiber ends—becomes critical. Its advantages include: Simple operation and. When deploying fiber optic cabling, one of the most critical decisions is how to terminate the fiber—either by splicing or using connectors.
