

Structural Features of AOC Optical Cables

Overview

An AOC cable is a type of interconnect that uses optical fiber media inside the cable, but the transceivers (optical-electrical conversion) are integrated into its ends. Because of that, the cable is considered “active” — i. Hence, active. AOC stands for Active Optical Cable. It integrates an optical cable of a specified length with two optical modules to form a convenient transmission channel, and the cable length can be customized according to customer application requirements. There are. An Active Optical Cable is an advanced cabling assembly that integrates fiber optic technology with active electronic components to enable high-speed data transmission over distances that would be impractical or impossible with traditional copper cables.
