

# Traffic Replicators and Splitters

## AI Overview

Traffic replicators duplicate network traffic for monitoring or analysis, while traffic splitters divide traffic for distribution or testing purposes.

### Traffic Replicators

Traffic replicators, also known as traffic duplicators, are devices or software that copy network traffic from one source to multiple destinations without affecting the original flow. They are commonly used for network monitoring, security analysis, and tool chaining. Advanced replicators can perform deep packet inspection (DPI), extract metadata, filter packets, and distribute traffic to multiple inline tools while monitoring the health of each tool to prevent a single failure from affecting the system. Virtual replicators provide similar functionality in software-defined or cloud environments, offering flexible deployment without requiring physical hardware.

### Traffic Splitters

Traffic splitters are used to divide traffic into multiple paths. In networking, this can refer to optical splitters in Passive Optical Networks (PONs), where a single optical signal is split into multiple outputs to serve multiple customers. The split ratio determines how the signal power is divided, commonly in powers of 2 (e.g., 1x2, 1x4, 1x32), and can be centralized (in a central office) or distributed (in field closures or pedestals). In web applications, traffic splitters are used for A/B testing, where website visitors are divided into groups to test different versions of a site. Methods include randomization and stratification, ensuring statistically valid comparisons of performance metrics.

### Key Differences and Applications

## Article Content

Hologos/traffic-splitter: Alter your routing table with ease.

traffic-splitter alters the routing table and enables you to route some traffic via a defined network interface.
