

What quota applies to photovoltaic combiner boxes

AI Overview

The quota of a photovoltaic combiner box refers to its maximum input capacity, typically defined by the number of PV strings and the current per string it can safely handle.

Understanding PV Combiner Box Quota

A photovoltaic (PV) combiner box consolidates the DC outputs from multiple solar panel strings into a single output for the inverter, simplifying wiring and enhancing system safety . The quota or capacity of a combiner box is determined by:

- Number of input strings: Standard combiner boxes typically support 6-24 strings, depending on the model and system size .
- Current per string: Each string usually carries 10-20A, and the combiner box must accommodate the sum of all string currents without exceeding its rated capacity .
- Voltage rating: The box must match or exceed the maximum system voltage to prevent insulation breakdown or electrical hazards .
- Total input power: Calculated based on the total installed PV capacity and panel specifications, ensuring the box can handle peak irradiation and component aging .

Key Considerations for Sizing

- Safety Margin: Always include a margin above the expected maximum current to account for irradiation peaks and aging of components .
