

What to do if the fiber optic light on your router is red

AI Overview

A red fiber optic light on your router indicates a Loss of Signal (LOS), meaning your router is not receiving a proper optical signal from your ISP.

Immediate Steps to Troubleshoot

1. Check for ISP Outages Before troubleshooting your equipment, verify if your Internet Service Provider (ISP) is experiencing a local outage. Visit their website or social media pages for updates, as a service disruption could be the cause of the red light.
2. Inspect the Fiber Optic Cable Examine the fiber optic cable for any visible damage, sharp bends, or loose connections. Ensure it is securely connected to the router's WAN or ONT port. Avoid bending or pulling the fiber, as this can disrupt the signal.
3. Power Cycle the Router/ONT Turn off your router or ONT, unplug it from the power source, wait 20-30 seconds, then plug it back in and power it on. Allow a few minutes for the device to fully reboot and check if the LOS light turns green.
4. Verify All Connections Ensure that all cables, including power, LAN, and fiber optic cables, are firmly connected. Loose or damaged connectors can cause a red light. If necessary, gently reseal the fiber connector.
5. Update Firmware or Reset Router If the red light persists, check if your router firmware is up to date. If needed, perform a factory reset by pressing the reset button (usually a small hole on the back) for 10-30 seconds. Remember, this will erase custom settings, so have your ISP credentials ready.
6. Contact Your ISP If none of the above steps resolve the issue, contact your ISP. Provide details such as the LOS light status (blinking or solid red), any observations about the cables or router, and your account information. The problem may require line-side verification or a technician visit.
